

Python Example

```
1 numbers = [1, 2, 3, 4]
```

```
2
```

```
3 doubled = list(map(lambda x: x * 2, numbers))
```

```
4
```

```
5 print(doubled)
```

Output : 1. [2, 4, 6, 8]

25. Cloud computing is the delivery of computing services such as servers, storage, databases, and analytics over the internet instead of using local computers or on the premises infrastructure. It reduces costs, ~~re~~ makes it easily ^{to be} accessible anywhere with internet connection. It has improved reliability and backup options.

① Infrastructure as a Service (IaaS)

→ Provides the basic computing infrastructure such as virtual servers, storage and networking. The cloud provider manages the hardware, while the customer manages the operating system, application and data.

Example : Microsoft Azure Virtual machine.

② Platform as a Service (PaaS)

provides a platform for developing, testing and deploying applications. The provider manages the infrastructure and operating system, allowing developers to focus on coding.

Example : Microsoft Azure App Service.
