

Companies use data warehouse solutions to drive business efficiency, build future analysis and predictions, ~~etc~~ enhance productivity and improve business success. These solutions convert data into readable dashboards that anyone in a company can analyze. Data is reported from one ^{central} system, enabling management to draw more meaningful business insights and make faster, better decisions.

3. A data lake is a repository designed to store large volumes of raw data, using low-cost cloud object storage. The data stored on a data lake can be structured, semi-structured, or unstructured and it is stored without any predefined schema. Data lakes use ELT - Data warehouses use ETL. Data lake stores raw data of all types, while data warehouse store processed data and structured data.

Data lake ~~sta~~ are easily scalable at a low cost, while data warehouse are more difficult and expensive to scale.

Data lakes are used by data scientists and engineers, while data warehouses are used by business analysts and professionals.

→ When a business would prefer a Data lake it would be because the business wants a low-cost, scalable storage solution before deciding how the data will be used. It would be because that organization needs to store large volumes of raw, diverse data for future, undefined use cases.

4. A Data mart is a specialized subset of a data warehouse that focuses on a specific line of business, department, or subject area. It is designed to provide quick and efficient access to relevant data for a defined group of users, such as marketing, sales or finance teams.
