

Example 1: Bias AI Hiring System

Company uses AI system to screen job applications, by using historical hiring data, AI favors male candidates. This creates discrimination in the hiring process. Qualified applicants maybe denied jobs because of gender.

Example 2: Collection of Personal data without Consent.

Mobile app secretly collects users locations, contacts & browsing information, Users not aware their info is being shared with advertisers. It violates user privacy. People may face unwanted advertising, identity theft risks etc.

Example 3: Mass facial-recognition surveillance

Intrudes privacy and may lead to misuse of false identification.

31. Data Governance

Its a set of policies, processes, roles, standards, and controls that ensure an organization's data is managed effectively securely, accurately and consistently throughout its lifecycle.

Key Components : Data Policy and Standards

Data Quality Management - Ensure accurate reliable data.

Roles and Responsibilities - Defines accountability

Data Security and Privacy - Protects sensitive information

Compliance Management - Meets legal requirements.

32. Bias in AI occurs when an artificial Intelligence system produces results that are systematically unfair, inaccurate or discriminatory toward certain individuals or groups. It is considered biased when its decisions consistently favour or disadvantage people based on the Gender, Race, Age, Nationality and Religion.
