

Pg 8 JSON is human readable, supports nested structures. Slower parsing for very big data.

PARQUET (columnar ~~store~~ Storage Format)

Apache Parquet is a binary columnar format optimized for analytical queries in data systems like Hadoop, Spark, and AWS Athena. It stores data by columns, allowing faster reads for specific fields.

AVRO (Row-based Storage Format)

Apache Avro is a binary row-based format often used in data streaming and serialization. It stores data with a schema, making it compact and fast.

The selection of a data storage format depends on data size, structure, performance requirements and the intended workflow, with CSV and JSON favored for simplicity and compatibility, while Parquet and Avro are preferred for large-scale analytics and streaming workloads.
