

1 Pg^a SECTION B : ARTIFICIAL INTELLIGENCE & MACHINE LEARNING.

11. Artificial Intelligence (AI) is technology that enables computers and machines to simulate human learning, comprehension, problem solving, decision making, creativity and autonomy.

→ Narrow AI (Weak AI)

This AI is built to perform specific tasks and operates within a limited domain. These excel at their assigned functions but cannot generalise beyond their programmed capabilities.

Example: Virtual assistants like Siri, Alexa and Cortana that respond to voice commands.

General AI (Strong AI)

This is a theoretical form of AI that would possess human like intelligence. Broad and adaptable autonomous.

Example: Learning and ~~reasonably~~ ^{reasoning} broadly across multiple domains without task-specific programming.

Adapting to new environments and solving problems it has never encountered. Has full human like abilities.

12. Machine Learning

It is a subset of artificial intelligence (AI) focused on algorithms that can learn the patterns of training data and, subsequently make accurate inferences about new data. This pattern recognition ability enables machine learning models to make decisions or predictions without explicit, hard coded instructions.
