

SECTION C

35. Computer Vision

I didn't always categorize it as part of Artificial Intelligence, I just always thought it's just an embedded cellphone thing that it can use your face recognition to open the locked screen. I also didn't know that the simplest things that we view as easy have such intense backgrounds. I found this one most exciting and eye opening.

36. The types of data formats and REST APIs.

I've used IBM Learning and Geeks which had different views on how these work & their explanation were different. Still not sure about data formats.

37. I think it can improve my career in the future

if I stay in this field because the system and the norms in my workplace are monotonous and rigid to change. ① If we can use data metrics to track the trends of quotes conversion rates and see clearer picture we can see where we need to improve. ② If we could train techs on AI to be more tech savvy we could eliminate repeat work.

③ If we could maximise on our data collection and analysis we could track customer satisfactory rates so that we can support customers better change their trust/belief in our service and win those lost customers in turn improve labour recovery. Also this will advise us on where we are off the mark price wise, making us more competitive.
